

ABSTRACT OF THE DISCLOSURE

This invention disclosure describes a stretchable and continuously adjustable strap of my design. It is shown that pairs of this type of straps can accommodate an essentially complete range of human waistlines from that of an infant to as large as 58" with minimal stretching, and up to 100" with 100% elongation of the elastic belts, when used in one of the recommended configurations in connection with a commercially available incontinence garments (a.k.a. belted undergarments). Straps of my invention can be made with elastic material that is readily available in the textile industry. Significant economic advantage inherent in my invention for mass-production and distribution is expected.
